

## **Project Description (Sales Analytics Dashboard)**

The Sales Analytics Dashboard is an interactive business intelligence project developed using Excel Pivot Tables, Pivot Charts, Slicers, and Dashboard Visualization techniques. The project analyzes retail sales data to identify sales trends, profit performance and regional performance across different years, categories, and states.

The dashboard transforms raw transactional data into meaningful visual insights that help businesses monitor performance, identify profitable areas, track losses, and support data-driven decision-making. Interactive slicers and charts allow users to dynamically filter and analyze data based on year, category, sub-category, and other business dimensions.

### **Business Insights**

- **Sales Growth Trend** - The dashboard shows a steady increase in sales from 2014 to 2017, indicating business growth and increasing customer demand over time.
- **Profitability** - Although sales increased, some categories and states generated negative profits, highlighting areas where operational costs or discounts may be affecting profitability.
- **Top Performance States** - States like California and New York contributed the highest sales and profits, making them key revenue-generating regions for the business.
- **Category Performance** - Technology and Furniture categories generated higher revenue compared to other categories, showing strong customer demand in those segments.
